

Reviews and Changes Doc.

Addition of Makueni County shapefile and to provide a placeholder of selecting other counties/shapefile/desired AOI (Area of Interest).

On the map area(starting on the left side), we need it to be;

- a. The name of the county/shapefile/desired AOI,
- b. Below it, The “Study area” needs to have its own placeholder.
- c. Have the map tools

At the center, is where the map lies.

On the right section, The basemaps selection settings do not align with the actual settings where it needs to have some small icons representing the actual basemap, i.e, OpenstreetMap needs to have a small icon image of OSM basemap, as well as the other basemaps. Also on the same, the basemap panel and the layers panel should have a drop down for minimizing the panel information to increase space for viewing the map information. The map should also have the scale.

The Map place holder and the should reduce its length and increase its width downwards, This is because the footer is left stranded far below leaving a great distance between the charts and the footer.

The KPI cards have stretched to the right because we don't have an “Export Report” card. The forecast card has its chart smaller than expected making it to have conflict of interest with the figures(78%).

Increase the font size on the side panel and orient the word spaces to meet the customers satisfaction. The Menu button is not responsive to the side panel.
